- $\blacktriangleright$  Protocols
- $\blacktriangleright$  Security APIs

 $\blacktriangleright$  Protocols

 $\blacktriangleright$  Security APIs

Xor is ubiquitous

- $\blacktriangleright$  Protocols
- $\blacktriangleright$  Security APIs

Xor is ubiquitous

Examples from a security API called CCA (Common Cryptographic Architecture):

$$
x, y, \{z\}_{x \oplus KP \oplus KM} \mapsto \{z \oplus y\}_{x \oplus KP \oplus KM}
$$

$$
x, y, \{z\}_{x \oplus KP \oplus KM} \mapsto \{z \oplus y\}_{x \oplus KM}
$$

- $\blacktriangleright$  Protocols
- $\blacktriangleright$  Security APIs

Xor is ubiquitous

Examples from a security API called CCA (Common Cryptographic Architecture):

$$
x, y, \{z\}_{x \oplus KP \oplus KM} \mapsto \{z \oplus y\}_{x \oplus KP \oplus KM}
$$

$$
x, y, \{z\}_{x \oplus KP \oplus KM} \mapsto \{z \oplus y\}_{x \oplus KM}
$$

Reasoning involves:

Commutativity:  $x \oplus y \simeq y \oplus x$ Associativity:  $(x \oplus y) \oplus z \simeq x \oplus (y \oplus z)$ Neutral element:  $x \oplus 0 \simeq x$ Involutivity:  $x \oplus x \simeq 0$ 

 $\mathbb{B}$

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$ <sub>-</sub>Zero, Xor  $\mapsto X$ <sub>-</sub>Xor, PC  $\mapsto$  NX<sub>-</sub>PC, etc.

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

 $\blacktriangleright$   $T_n(A)$  is sortable as well;

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

- $\blacktriangleright$   $T_n(A)$  is sortable as well;
- ighthrow the multiset of A-leaves of a  $T_{\rm x}(A)$ -term can be sorted (and removed when possible) into a list;

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

- $\blacktriangleright$   $T_n(A)$  is sortable as well;
- ighthrow the multiset of A-leaves of a  $T_{\rm x}(A)$ -term can be sorted (and removed when possible) into a list;

 $\blacktriangleright$  *list(A)* is sortable.
## Stratifying and normalizing a term

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

The typing of t' is  $\mathcal{T}_{\mathsf{x}}(\mathcal{T}_{\mathsf{n}}(\mathcal{T}_{\mathsf{x}}(\ldots(\emptyset))))$  for k large enough.  $k$  layers

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

- $\blacktriangleright$   $T_n(A)$  is sortable as well;
- In the multiset of A-leaves of a  $T_{x}(A)$ -term can be sorted (and removed when possible) into a list;

 $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc$ 

 $\blacktriangleright$  list(A) is sortable.

## Stratifying and normalizing a term

Step 1 Translate a term  $t$  into  $t'$  according to the mapping  $0 \mapsto X$  Zero, Xor  $\mapsto X$  Xor, PC  $\mapsto NX$  PC, etc.

The typing of t' is  $\mathcal{T}_{\mathsf{x}}(\mathcal{T}_{\mathsf{n}}(\mathcal{T}_{\mathsf{x}}(\ldots(\emptyset))))$  for k large enough.  $k$  layers

**Step 2** A type is sortable if it is equipped with a decidable equality and a decidable total ordering. If A is sortable, then

- $\blacktriangleright$   $T_n(A)$  is sortable as well;
- In the multiset of A-leaves of a  $T_{x}(A)$ -term can be sorted (and removed when possible) into a list;

 $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right. \quad \left\{ \begin{array}{ccc$ 

 $\blacktriangleright$  list(A) is sortable.
