Double-glueing and orthogonality

14/06/2011 1 / 29

# Summary

#### 3 Orthogonality

990

- $\,$   $\,$  Linear logic ( $\sim$  1986): a fruitful decomposition of logic
- Double-glueing: Hyland and Schalk (2002)
- A unified framework inspired from realizability
- Better understanding of constructions underlying LL models

#### Models from the book: Coherent spaces

Coherent spaces are a historical model of LL designed by Girard.

Historical definition

A coherent space is a pair  $R = (|R|, \bigcirc_R)$  where  $\bigcirc_R$  is a reflexive relation on |R|.

Sac

#### Models from the book: Coherent spaces

Coherent spaces are a historical model of LL designed by Girard.

Historical definition

A coherent space is a pair  $R = (|R|, \bigcirc_R)$  where  $\bigcirc_R$  is a reflexive relation on |R|.

#### Folklore definition

We pose  $u \perp v$  whenever  $|u \cap v| \leq 1$ . A coherent space is a pair  $R = (|R|, C_R)$  where  $C_R \subseteq \mathfrak{P}(|R|)$ , called the set of **cliques** of R is s.t.  $C_R = C_R^{\perp \perp}$ .

 ${\, \bullet \, }$  A morphism from R to S is a clique of  $R^{\perp} \, {\, \mathfrak N \, } S$ 

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Phase semantics is another historical (but this time complete) model of LL.

Phase semantics Let  $\mathcal{M}$  be a commutative monoid and  $\bot\!\!\!\bot \subseteq \mathcal{M}$  a pole. We pose  $x \perp y$ whenever  $xy \in \bot\!\!\!\bot$ . A **fact** is a subset  $F \subseteq \mathcal{M}$  s.t.  $F = F^{\perp \perp}$ .

• A morphism from E to F is an element  $x \in (EF^{\perp})^{\perp}$ .

(1) 「「「「」」」 「」 「」 「」 「」 「」 「」 「」 「」 「」 」 」 」 」

Finiteness spaces are a more recent LL model, and in particular of differential LL.

Finiteness spaces

We pose  $u \perp v$  whenever  $u \cap v$  is finite. A finiteness space is a pair  $R = (|R|, \mathcal{F}_R)$  where  $\mathcal{F}_R \subseteq \mathfrak{P}(|R|)$ , called the set of **finitary sets** of R, is s.t.  $\mathcal{F}_R = \mathcal{F}_R^{\perp \perp}$ 

• Morphisms are relations preserving  ${\mathcal F}$ , anti-preserving  ${\mathcal F}^\perp$ 

(日本) (日本) (日本) 日本

We can detect a common pattern in the previous examples.

- The objects are two-parts:
  - an underlying structure (a set, a monoid, ...)
  - additional information (clique, facts, finitary sets)
- A notion of orthogonality over this information
  - ${\ \bullet \ }$  restriction to closed sets  $A=A^{\perp\perp}$
- Morphisms are underlying morphisms (a relation, an element) preserving orthogonality properties

Axiomatizing this properties permits to define the double-glueing construction.

イロト 不得下 イヨト イヨト 二日

- Our new formulas will be pairs (U, X) where:
  - $\bullet~U$  is an abstract set of  ${\bf proofs}$
  - X is an abstract set of **counter-proofs**
  - both are living in the model

- With enough provisos, we can lift any structure from the base model
  - Nothing added, jush refining things up

#### The practical case

Let  ${\bf C}$  be a model of (a subsystem of) LL, and  $\bot \in {\bf C}$  a return type.

We define the glued category  $\mathbb{G}(\mathbf{C})$  as follows:

• Objects are triples A = (R, U, X) where

• 
$$R \in \mathbf{C}$$
  
•  $U \subseteq \mathbf{C}(1, R) \quad \rightsquigarrow \text{ proofs of } A: u \Vdash^{p} A$   
•  $X \subseteq \mathbf{C}(R, \bot) \quad \rightsquigarrow \text{ counter-proofs of } A: x \Vdash^{o} A$ 

Let  ${\bf C}$  be a model of (a subsystem of) LL, and  $\bot \in {\bf C}$  a return type.

We define the glued category  $\mathbb{G}(\mathbf{C})$  as follows:

• Objects are triples 
$$A = (R, U, X)$$
 where

• 
$$R \in \mathbf{C}$$
  
•  $U \subseteq \mathbf{C}(1, R) \quad \rightsquigarrow \text{ proofs of } A: u \Vdash^p A$   
•  $X \subseteq \mathbf{C}(R, \bot) \quad \rightsquigarrow \text{ counter-proofs of } A: x \Vdash^o A$   
• Morphisms  $f: \mathbb{G}(\mathbf{C})(A, B)$  are  $f: \mathbf{C}(R, S)$  s.t.

$$\begin{array}{ll} \circ & \forall u \Vdash^{p} A, u; f \Vdash^{p} B & \text{(i.e. } f(U) \subseteq V \text{)} \\ \circ & \forall y \Vdash^{o} B, f; y \Vdash^{o} A & \text{(i.e. } f^{-1}(Y) \subseteq X \text{)} \end{array}$$

 $\exists \rightarrow$ 

Let  ${\bf C}$  be a model of (a subsystem of) LL, and  $\bot \in {\bf C}$  a return type.

We define the glued category  $\mathbb{G}(\mathbf{C})$  as follows:

• Objects are triples 
$$A = (R, U, X)$$
 where

• 
$$R \in \mathbf{C}$$
  
•  $U \subseteq \mathbf{C}(1, R) \longrightarrow \text{proofs of } A: u \Vdash^{p} A$   
•  $X \subseteq \mathbf{C}(R, \bot) \longrightarrow \text{counter-proofs of } A: x \Vdash^{o} A$   
• Morphisms  $f : \mathbb{G}(\mathbf{C})(A, B)$  are  $f : \mathbf{C}(R, S)$  s.t.  
•  $\forall u \Vdash^{p} A, u; f \Vdash^{p} B$  (i.e.  $f(U) \subseteq V$ )  
•  $\forall y \Vdash^{o} B, f; y \Vdash^{o} A$  (i.e.  $f^{-1}(Y) \subseteq X$ )

We could already lift the structure from C to  $\mathbb{G}(C)$  but is is actually better to refine our definition now.

### Skimming with orthogonality: the slack case

 $\mathbb{G}(\mathbf{C})$  contains too much junk, so we add orthogonality conditions:

- We set a family of relations  $\perp_R \subseteq \mathbf{C}(1,R) \times \mathbf{C}(R,\perp)$
- $\bullet \perp$  must be compatible with the structure of  ${\bf C}$ 
  - Essentially forward stability of  $\perp$  w.r.t the connectors (stay tuned!)

### Skimming with orthogonality: the slack case

 $\mathbb{G}(\mathbf{C})$  contains too much junk, so we add orthogonality conditions:

- We set a family of relations  $\perp_R \subseteq \mathbf{C}(1,R) \times \mathbf{C}(R,\perp)$
- $\bullet \perp$  must be compatible with the structure of  ${\bf C}$ 
  - Essentially forward stability of  $\perp$  w.r.t the connectors (stay tuned!)

Slack category

The slack category  $\mathbb{S}({\bf C})$  is the restriction of  $\mathbb{G}({\bf C})$  where (R,U,X) satisfies  $U\perp X$

### Skimming with orthogonality: the slack case

 $\mathbb{G}(\mathbf{C})$  contains too much junk, so we add orthogonality conditions:

- We set a family of relations  $\perp_R \subseteq \mathbf{C}(1,R) \times \mathbf{C}(R,\perp)$
- $\bullet \perp$  must be compatible with the structure of  ${\bf C}$ 
  - ${\scriptstyle \circ}$  Essentially forward stability of  ${\scriptstyle \perp}$  w.r.t the connectors (stay tuned!)

#### Slack category

The slack category  $\mathbb{S}({\bf C})$  is the restriction of  $\mathbb{G}({\bf C})$  where (R,U,X) satisfies  $U\perp X$ 

#### Remark

 $\mathbb{G}(\mathbf{C})$  is exactly  $\mathbb{S}(\mathbf{C})$  where  $\perp_R$  is the full relation, i.e.  $u \perp x$  for any u and x. Hence any of the following results can be applied to  $\mathbb{G}(\mathbf{C})$ .

- In any category, let  $\bot\!\!\!\bot \subseteq {\bf C}(1,\bot)$  and pose  $u\perp x$  whenever  $u;x\in \bot\!\!\!\bot$ 
  - These are the **focussed** orthogonalities
  - The best case for compatibility properties
  - ${\ {\bullet} \ }$  The full orthogonality is focussed:  ${\ \ \bot \ \ } = {\bf C}(1, \bot)$
- In the category Rel of sets and relations:
  - $\operatorname{\mathbf{Rel}}(1,R) \cong \operatorname{\mathbf{Rel}}(R,\bot) \cong \mathfrak{P}(R)$
  - $u \perp x$  whenever  $u \cap x$  at most a singleton
  - $u \perp x$  whenever  $u \cap x$  is finite

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

### Lifting the structure: Additives

Lifting the additives is the easy part: as in the intuitionnistic case!

• Some side conditions...

- projections must be positive, that is:  $w; \pi_i \perp x_i \Rightarrow w \perp \pi_i; x_i$
- dually injections must be negative:  $u_i \perp \iota_i; z \Rightarrow u_i; \iota_i \perp z$

### Lifting the structure: Multiplicatives

Multiplicatives are hybrid disjunction/conjunction: lifting is asymmetric...

Image: A match a ma

### Compatibility requirements

For multiplicatives, the requirements to preserve the structure are: • for any  $u : \mathbf{C}(1, R)$ ,  $v : \mathbf{C}(1, S)$  and  $z : \mathbf{C}(R \otimes S, \bot)$ ,

$$\left. \begin{array}{c} u \perp_R z[v] \\ v \perp_S z[u] \end{array} \right\} \Rightarrow u \otimes v \perp_{R \otimes S} z$$

 ${\ }$  for any  $u:{\mathbf C}(1,R)\text{, }y:{\mathbf C}(S,\bot)$  and  $f:{\mathbf C}(R,S)\text{,}$ 

$$\begin{array}{c} u; f \perp_S y \\ u \perp_R f; y \end{array} \right\} \Rightarrow \hat{f} \perp_{R \multimap S} u \multimap y$$

 ${\ }$  for any  $u:{\mathbf C}(1,R)$  and  $x:{\mathbf C}(R,\bot),$ 

$$u \perp_R x \Rightarrow \mathrm{id}_1 \perp_1 u; x$$

• for any  $u : \mathbf{C}(1, R)$  and  $x : \mathbf{C}(R, \bot)$ ,

$$u \perp_R x \Leftrightarrow x^* \perp_{R^*} u^*$$

Pierre-Marie Pédrot (ENS Lyon)

### Lifting the structure: Exponentials

- Lifting the exponential is quite problematic.
- We need a compatible transformation  $\kappa_R : \mathbf{C}(1, R) \to \mathbf{C}(1, !R)$ 
  - Compatibility is expressed as a herd of coherence diagrams.
- There is no unicity of such a transformation...
  - yet a canonical one:  $\kappa(u) = 1 \xrightarrow{m} !1 \xrightarrow{!u} !R$

#### Lifting the structure: Exponentials

### An Enlighting Example

- In **Rel**, take  $!A = \mathcal{M}_{fin}(A)$ 
  - free commutative comonoid
- Canonical transformation is:

$$\kappa(u) = \{\mu \in \mathcal{M}_{fin}(A) \mid |\mu| \subseteq u\}$$

- sounds familiar:
  - similar to multiset-Coh
  - ${\scriptstyle \bullet} \,$  similar to  ${\bf Fin}$

- The slack construction is not satisfactory enough:
  - Very few examples from the litterature
  - Still a lot of junk lying around
- But we did not reach our classical examples yet.
- We forgot a requirement: the **closedness** of (counter-)proofs sets by bi-orthogonality

#### Tight category

The tight category  $\mathbb{T}(\mathbf{C})$  is the restriction of  $\mathbb{S}(\mathbf{C})$  to objects of the form  $(R, U, U^{\perp})$  where  $U = U^{\perp \perp}$ .

200

#### Tight category

The tight category  $\mathbb{T}(\mathbf{C})$  is the **restriction** of  $\mathbb{S}(\mathbf{C})$  to objects of the form  $(R, U, U^{\perp})$  where  $U = U^{\perp \perp}$ .

In a tight category, the set of counter-proofs is entirely defined by the set of proofs, and conversely. Hence, we will note objects (R, U).

In a tight category, the set of counter-proofs is entirely defined by the set of proofs, and conversely. Hence, we will note objects (R, U).

・ロト ・四ト ・ヨト ・ヨト

Now we can describe our three leading examples through tight categories.

- Coherent spaces is the tight category over Rel with  $u\perp_{{\bf Coh}}x\equiv |u\cap x|\leq 1$
- Phase semantics on  $(\mathcal{M}, \bot)$  is the tight category over the one-object category  $C_{\mathcal{M}}$  with the  $\bot$ -focussed orthogonality
- Finiteness spaces is the tight category over Rel with  $u\perp_{\mathbf{Fin}} x\equiv |u\cap x|<\infty$

### Additional requirements

In order to define the structure lifting onto  $\mathbb{T}(\mathbf{C}),$  we need to strengthen the hypotheses on  $\bot.$ 

- $\perp$  must be **precise**, i.e. the forward stability for multiplicatives is also reverse
- the projections and injections must be **focussed**, i.e. both positive and negative

Sac

- 4 同 1 - 4 回 1 - 4 回 1

In order to define the structure lifting onto  $\mathbb{T}(\mathbf{C}),$  we need to strengthen the hypotheses on  $\bot.$ 

- $\perp$  must be **precise**, i.e. the forward stability for multiplicatives is also reverse
- the projections and injections must be **focussed**, i.e. both positive and negative

#### Polarization

When the previous requirements are met, the following (dual) results hold:

- objets of the form (R, X<sup>⊥</sup>, X) in S(C) are stable under negative connectives (⊥, 𝔅, ⊤, 𝔅)
- objets of the form (R,U,U<sup>⊥</sup>) in S(C) are stable under positive connectives (1, ⊗, 0, ⊕)

# Lifting of linear structure...

From the previous lemma, one can deduce that we only need to close proofs (resp. counter-proofs) for positive (resp. negative) connectors.

So, for objects of  $\mathbb{T}(\mathbf{C})$ , we define the following (the others connectives are dual):

$$1 = (1, \{ \mathrm{id}_1 \}^{\perp \perp})$$
$$(R, U) \otimes (S, V) = (R \otimes S, (U \otimes V)^{\perp \perp})$$
$$\top = (\top, \mathbf{C}(1, \top))$$
$$(R, U) \& (S, V) = (R \& S, U \& V)$$
$$(R, U)^* = (R^*, U^{\perp})$$

#### ... nice try, but not yet

Alas! This is not sufficient to lift the monoidal structure...
we only get a polycategory

• we need  $\perp$  to be **self-stable** (awfully adhoc)

A (1) < (2) < (2) </p>

... nice try, but not yet

• Alas! This is not sufficient to lift the monoidal structure...

```
• we only get a polycategory
```

```
• we need \perp to be self-stable (awfully adhoc)
```

Lifting

Let  $\mathbf{C}$  be a model of M(A)LL.

- (1) Suppose  $\perp$  is precise and self-stable, and that the multiplicative canonical isomorphisms are focussed. Then  $\mathbb{T}(\mathbf{C})$  inherits its multiplicative structure from  $\mathbf{C}$ .
- ② Suppose that the canonical morphisms for the additive structure are focussed. Then T(C) inherits its additive structure from C.

#### Focalization

Whenever  $\perp$  is focussed, all the previous conditions are automatic.

- $\bullet$  For phase semantics,  $\perp$  is  $\perp\!\!\!\!\perp$  -focussed. The previous construction applies flawlessly.
- $\bullet\,$  For finiteness and coherent spaces,  $\perp$  is also precise and self-stable; there are slight mismatches, but they can be worked out in a straight way

# Lifting the exponential

- In order to lift the exponentials, self-stability is not sufficient
- We need a stronger (but cleaner) notion: **stability** 
  - essentially  $(U^{\perp\perp}\multimap V^{\perp})^{\perp}=(U\multimap V^{\perp})^{\perp}$
- $\bullet$  Construction is similar to  $\mathbb{S}(\mathbf{C})$  (up to closure):

$$!(R,U) = (!R,\kappa(U)^{\perp\perp})$$

Sac

イロト イポト イヨト イヨト 二日

# Lifting the exponential

- In order to lift the exponentials, self-stability is not sufficient
- We need a stronger (but cleaner) notion: stability
   essentially (U<sup>⊥⊥</sup> → V<sup>⊥</sup>)<sup>⊥</sup> = (U → V<sup>⊥</sup>)<sup>⊥</sup>
- $\bullet$  Construction is similar to  $\mathbb{S}(\mathbf{C})$  (up to closure):

$$!(R,U) = (!R,\kappa(U)^{\perp\perp})$$

- Focussed orthogonalities are stable
  - but exponential from phase semantics is not of that kind
- $\perp_{\mathbf{Coh}}$  and  $\perp_{\mathbf{Fin}}$  are not stable...
  - but it works anyway...
- Quite a mess!

イロト イポト イヨト イヨト 二日

### Non-uniform exponentials

• The previous construction is defined pointwise:

 $\kappa(U) = \{\kappa(u) \mid u \in U\}$ 

200

イロト 不得 トイヨト イヨト 二日

### Non-uniform exponentials

• The previous construction is defined pointwise:

 $\kappa(U) = \{\kappa(u) \mid u \in U\}$ 

- $\bullet\,$  but  $\kappa\,$  can also be defined on whole sets
  - non-uniform exponentials, as in games
  - close to explain phase semantics exponential
  - requirements less strict than the pointwise case (inclusion vs. equality)

$$U \subseteq V \Rightarrow \kappa(U) \subseteq \kappa(V)$$
$$\kappa(U); \varepsilon \subseteq U$$
$$\kappa(U); \delta \subseteq \kappa(\kappa(U))^{\perp \perp}$$

. . .

Double-glueing constructions come with a bunch of functors for free:

- $\bullet$  Adjunctions between  $\mathbb{G}(\mathbf{C})\text{, }\mathbb{S}(\mathbf{C})\text{, }\mathbb{T}(\mathbf{C})$
- More interestingly, if  $\perp_1$  and  $\perp_2$  are compatible enough,  $\mathbb{T}_1(\mathbf{C}) = \mathbb{T}_2(\mathbf{C})$  can lead to pseudo-inclusion functors
  - which are structure preserving

(人間) 人 田 ト 人 田 ト

Double-glueing constructions come with a bunch of functors for free:

- $\bullet$  Adjunctions between  $\mathbb{G}(\mathbf{C}),\,\mathbb{S}(\mathbf{C}),\,\mathbb{T}(\mathbf{C})$
- More interestingly, if ⊥<sub>1</sub> and ⊥<sub>2</sub> are compatible enough, T<sub>1</sub>(C) T<sub>2</sub>(C) can lead to pseudo-inclusion functors
   which are structure preserving
- Example in Rel with  $\perp_{Coh} \subseteq \perp_{Fin}$ : Hyvernat's functor  $\Phi : Coh \rightarrow Fin$  where:

$$\Phi(R,U) = (R, U^{\perp_{\mathbf{Coh}} \perp_{\mathbf{Fin}}})$$

• Requirements still unclear...

14/06/2011 27 / 29

- A powerful construction
  - Instanciates many interesting models
- A bit too abstract (usine à gaz ?)
- Not very useful in the intuitionnistic case
- A tool to design new models from scratch
  - that capture interesting behaviours
